We need to remove all observations of genes with all 0 read counts.

Q. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns). Tip: What will rowSums() of countData return and how could you use it in this context?

Here we check if the sum across each row is larger than 0 and only keep those rows.

```
# Filter count data where you have 0 read count across all samples.
to.keep.inds <- rowSums(countData) > 0
nonzero.counts = countData[to.keep.inds, ]
head(countData)
```

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Cell cycle has the most significant entities p-value. This matches the earlier KEGG result. Reactome has more specificity of genes and might have more possible results for the pathways involved.
